

Ultrasound Abdomen – Advanced Course

November 22th/23th of 2019 Anatomiegebouw, Utrecht

This 2-day-course is **intended for veterinarians already experienced in basic ultrasonography of the abdomen and competent in two dimensional scanning of the main abdominal organs.** In the practical sessions the course will cover achieving good imaging planes of the adrenal glands, pancreas, lymph nodes and main abdominal blood vessels as well as the visualization of small gastrointestinal structures (layering, papilla duodeni, ileocaecal valve).

The course will include lectures and echo features on normal and abnormal findings in these organs. Standard shunt and doppler diagnostic used in abdominal ultrasound will also be covered.

During the practical sessions the participants will rotate in small groups of 4-5 participants through different stations with experienced instructors where individual coaching of how to obtain good imaging planes is the main focus. A great opportunity to pick up the techniques of a basic echocardiographic examination in a one-on-one situation

Course Date: **22th of November, 2019** **08:45-17:30** **followed by borrel**
 23th of November, 2019 **09:00-16:30**
